DISEASE: Loss of the extracellular domain causes constitutive activation of the Notch protein, which leads to hyperproliferation of glandular epithelial tissues and development of mammary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in lung, moderately in heart kidney, and at lower levels in the ovary and skeletal muscle. A very low expression is seen in the brain, intestine, liver and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May regulate branching morphogenesis in the developing vascular system.

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEVELOPMENTAL STAGE: Highly expressed in endothelial cells during embryonic development from 9.0 dpc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Natl. Acad. Sci. U.S.A. 98:9026-9031(2001).
FUNCTION: Functions as a receptor for membrane-bound ligands Jagged, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released motth intracellular company is formant transparent to the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released with the released wi

                                                                                                                            J. Pathol. 154:785-794(1999).

FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl. Jaggeda and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with
            RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs. May regulate branching morphogenesis in the developing vascular system (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HUMAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            187

Genomics 18:667-672(1993)
-i- FUNCTION: STRUCTURAL COMPONENT OF CONNECTIVE TISSUE MICROFIBRILS THAT BINDS CALCIUM. FIBRILIN-1-CONTAINING MICROFIBRILS PROVIDE LONG-TERM FORCE BEARING STRUCTURAL SUPPORT.
-i- SIMILARITY: Contains 47 EGF-like domains.
-i- SIMILARITY: Contains 7 TGF-beta binding protein (TGFBP) domains.

MOI. Biol. 275:725-730(1998).

TISSUES SPECIFICITY: STRONGLY EXPRESSED IN EARLY EMBRYONIC NEURAL TISSUES (BRAIN, SPINAL CORD, DORSAL ROOT GANGLIA); LESS IN OTHER TISSUES SUCH AS CELLS AROUND CARTILAGE, MYOCARDIUM, LUNG MESENCHYMAL CELLS, AND LIVER. AFTER HATCHING EXPRESSION IS RESTRICTED TO NEURAL TISSUES INCLUDING REFINA.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

SIMILARITY: Contains 5 VWFC domains.

SIMILARITY: Contains 6 EGF-like domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence analysis of an 1.5 Mb
          PTW: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NET). This fragment is then cleaved by presentiln dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                    bonds (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein.
proteolytical processing NICD is translocated to TISSUE SPECIFICITY: Ubiquitously expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: Functions as a receptor for membrane-bound ligands Jagged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NTCD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide

I SUBCELLULAR LOCATION: Type I membrane protein.

I TISSUE SPECIFICITY: Highly expressed in endothelial cells, platelets, cells of myeloid origin, such as monocytes and neutrophils. Not expressed in cells of lymphoid origin.

I PTM: N- and O-glycosylated.

I SIMILARITY: Contains 1 C-type lectin family domain.

SIMILARITY: Contains 5 EGF-like domains as collectin receptor.

CAUTION: Has been sometimes referred to as a collectin receptor.

CAUTION: According to Ref. 5, Clq is not a ligand for ClQR1.
